

Joaquin Gonzalez-Salgado

(909) 904-7494 | Claremont, CA | jgonzalezsalgado@hmc.edu | [jgonzs.github.io](https://github.com/jgonzs) | [linkedin.com/in/joaquin-e-gs](https://www.linkedin.com/in/joaquin-e-gs) | U.S. Citizen

EDUCATION

Harvey Mudd College

B.S. in Engineering (Electrical & Computer Engineering) — GPA: 3.7/4.0

Claremont, CA

Expected May 2028

EXPERIENCE

Electrical Engineer, Sponsored Engineering Project

Aug. 2026 – Present

Blue Origin

Claremont, CA

- Selecting and validating a redundant multi-sensor suite (radar, LiDAR, proximity, IMU, computer vision) to track vehicle-side launch umbilical panels, weighing accuracy, cost, harsh-environment reliability, and EMI risk
- Integrating sensor data into control logic with Kalman filtering to align ground-side umbilical panels in all 6 degrees of freedom to about 0.1 mm for automated mating of propellant, power, and data lines
- Own component selection, sensor installation and packaging design, and hardware procurement for the full-scale model
- Work cross-functionally with Blue Origin engineers on prototype build-up, testing, and design verification

Hardware & Firmware Researcher

Aug. 2025 – Present

Analog Circuitry Engineering Lab — PI: Prof. Matthew Spencer

Claremont, CA

- Designed low-noise analog front ends with impedance matching, instrumentation amplifiers, and up to 7,000x gain, moving a dual-battery instrument to a single-supply design with integrated battery management
- Brought up and verified 4 PCB revisions in a 10-week sprint (2 single-supply analog boards, 2 nRF5340 microcontroller boards), debugging power faults with oscilloscopes, function generators, and bench supplies

PCB Designer, Electrical Team

Sep. 2025 – Present

MuddSub Autonomous Underwater Vehicle Team (RoboSub)

Claremont, CA

- Contributing to the electrical team's KiCad design of Rev. 1 power and signal boards for an 8-thruster AUV, now entering fabrication and verification
- Boards convert separate thruster and electronics batteries into 12V/5V/3.3V rails via switching regulators and route a Teensy 4.1 driving 8 thruster PWM channels with relay and hardware-kill control

Electrical Engineer, Electrical & Engine Team

Jan. 2026 – Present

Harvey Mudd Racing (Formula SAE)

Claremont, CA

- Designing a modular low-voltage harness of 6 subharnesses from a 12V battery and shutdown circuit to a MoTeC PDM30 and M130 ECU, with relay-switched fuel pump, ignition coils, and injectors, within a \$5.5k budget
- Setting up the CAN bus between the ECU, power distribution module, and lambda sensor, and configuring ECU firmware and tuning to start the engine under electrical power

PROJECTS

NFC Business Card PCB | *KiCad, NXP NT3H2111, VNA*

Jul. 2026 – Aug. 2026

- Designed and assembled a 2-layer NFC business card around an NXP NT3H2111 tag IC with a custom PCB-trace loop antenna, impedance-matching the antenna to the 13.56 MHz NFC carrier with VNA measurements
- Laid out the card in KiCad with an LED indicator, test points, and a silkscreen QR code, and released fab-ready Gerbers, BOM, and pick-and-place files

Autonomous Underwater Vehicle (SONAR Mapping) | *Teensy 4.0, Op-Amps*

Jan. 2026 – May 2026

- Designed a 4-stage, 80 dB SONAR receive chain with a Sallen-Key bandpass filter ($f_0 = 3$ kHz) and max detector, distributing gain to preserve 121.8 kHz bandwidth, which mapped harbor depths of 1.65–2.13 m (± 0.15 m)

36V Electric Vehicle | *Power Distribution, Circuit Protection, Raspberry Pi*

Jan. 2026 – May 2026

- Led a team building a 36V electric vehicle that holds a steady 15 mph by designing its power distribution and protection system (motor controllers, relays, fuses, breakers)

TECHNICAL SKILLS

Hardware: Analog Front Ends, PCB Layout & Bring-Up, Power Distribution, BMS, nRF5340, STM32, ESP32

Languages & Tools: Python, C, C++, MATLAB, Verilog, SystemVerilog, VHDL, Git, CMake, Jupyter

Engineering Software: Altium, KiCad, LTspice, Lattice Radiant, Questa, Quartus, LabVIEW, Fusion CAD

Firmware & Embedded: Zephyr RTOS, Bare-Metal C, I2C, SPI, UART, CAN, Bluetooth, ADC, PWM, IoT

Controls: Feedback Control, PID Control Loops, Motor Speed Control, Sensor Integration & Calibration

Lab Instrumentation: Oscilloscope, Multimeter, Function Generator, Power Supply, VNA, Data Acquisition
